

#### Project Team Members:

- Junyu Teoh

- 1) I chose the first project, connectFour
- 2) My goal is to finish the project with SQS by myself. There are a few methods that I think I will have to implement. Those being:
  - Method to check boxes.
  - Method to retrieve information from SQS
  - Method to upload new information to SQS
- 3) I will use Amazon SQS, as I feel that's the most efficient way to implement this program. If I have a team member, he or she will implement SNS.
- 4) It will allow two users to play a modified Tic-Tac-Toe game through the cloud. However in this game, we require 5 instead of 3. We will check all directions, horizontally, vertically, diagonally and inverse diagonally. Communication between clients will be strictly through the amazon AWS services.
